CUSTOMER DEMO GUIDE

# CRM Data Quality

AI-assisted matching and controlled repair

## What the walkthrough demonstrates

57 synthetic match candidates require review before any merge decision.

31 repair proposals include 9 holds for unresolved duplicate dependencies.

The simulation verifies a repair, blocks stale data and flags a recovery conflict.

## Architecture

Synthetic fixtures > matching > mock review > in-memory repair and verification

Developer-test audit > PostgreSQL outbox > Make > Airtable > reconciliation

## Developer-test audit

Four acknowledgments matched provider records. Three events were pending.

One HTTP 401 was tied to the exact event and retained on hold.

PostgreSQL records the rejection evidence and the decision to close without replay.

## Reproduce the offline demo

Run from the project root with Python 3.13 or newer.

Install the pinned RapidFuzz dependency once. Demo execution runs offline.

```
python -m pip install -r requirements-m2.txt

python -B scripts/demo_controlled_repair.py
```

Scope: synthetic repair simulation and developer-test delivery evidence.

Production deployment and commercial outcomes are outside this evaluation.
